PC – SHOOT

COMPUTER AIDED CONTROL SYSTEM FOR SHOOTING RANGES

The PC-Shoot program has been developed to provide the firearms training officer with a flexible facility with which to carryout basic classification shooting exercises through to the advance decision scenarios for specialist groups.

The user friendly target control and monitoring system enables the operator to easily control the target units directly from the PC or run previously configured programs from a C9200M range control handset.

The system comprises of a host computer which displays set-up and target status, plus a control interface between the computer and the target units.

The computer software for PC Shoot comprises of:-

    a)   A windows application program
    b)   Target sequencing profiles
    c)   Results file
    d)   C9004RM interface unit

PC SHOOT

PC-Shoot is a Menu driven system with software designed to enable anyone with little or no experience of computers, to operate and configure shoot programs.

The above example shows different commands being used and how they will be displayed. Any command entered in 'All' will automatically be copied to the individual targets. Up to 600 seconds of programming time is available

A Pc-shoot program in operation
